## Chapter 2 – SIMULINK Basics

These lecture notes contain copyrighted materials. Therefore, this lecture notes are free to be used only by the students who take this course. It is subject to permission to be given to third parties and to be reproduced by any method and used elsewhere. Commercial use of this notes are prohibited. Otherwise, legal action will be taken.

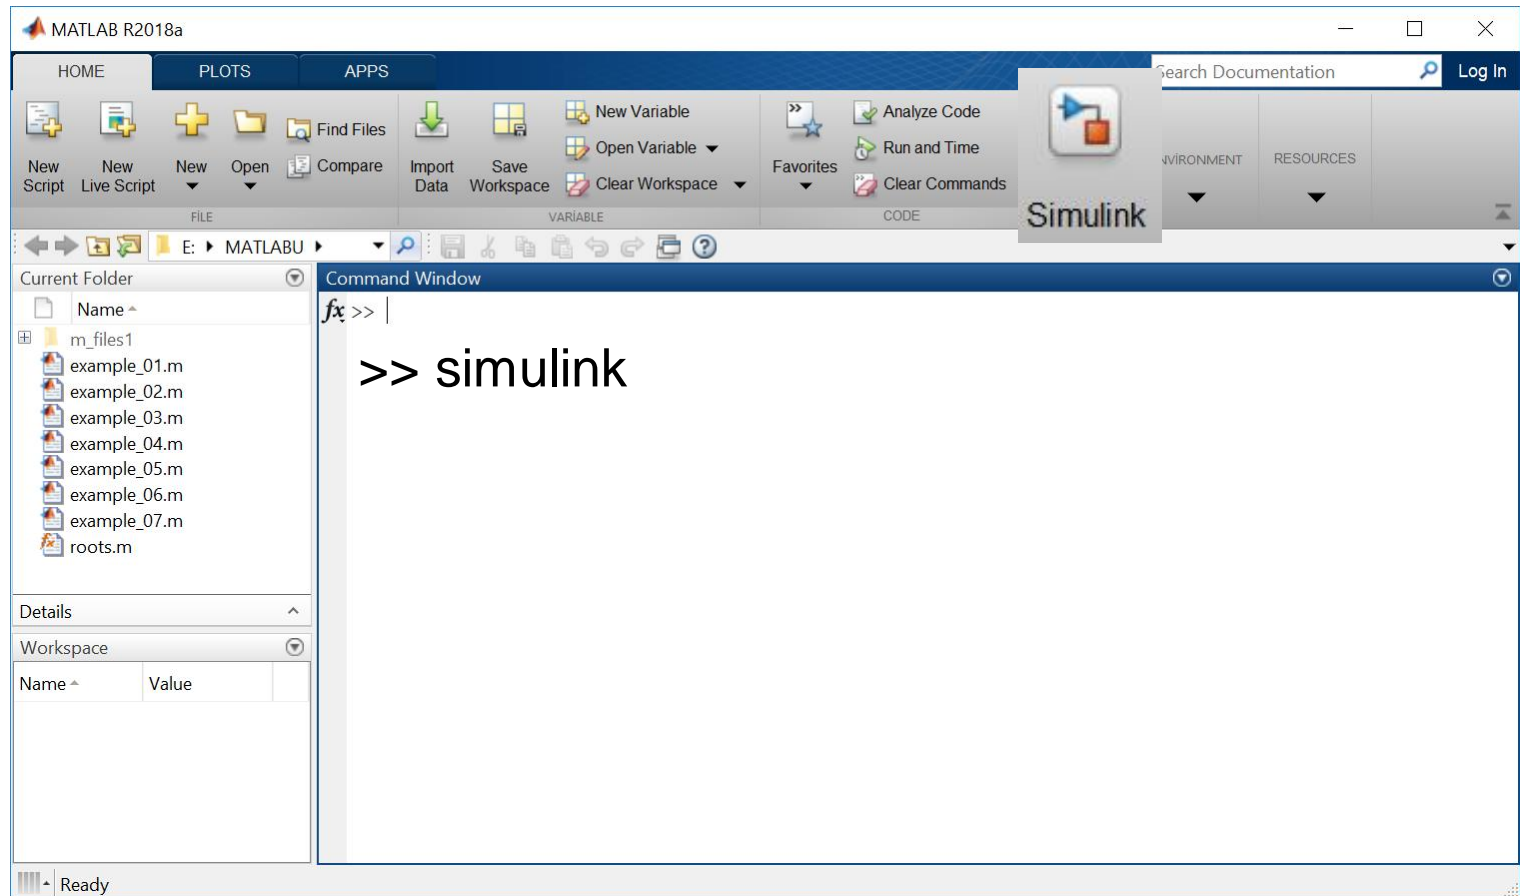

Publication of these course presentation notes by others on any platform is subject to permission. **Remember, Stealing is not sharing.**

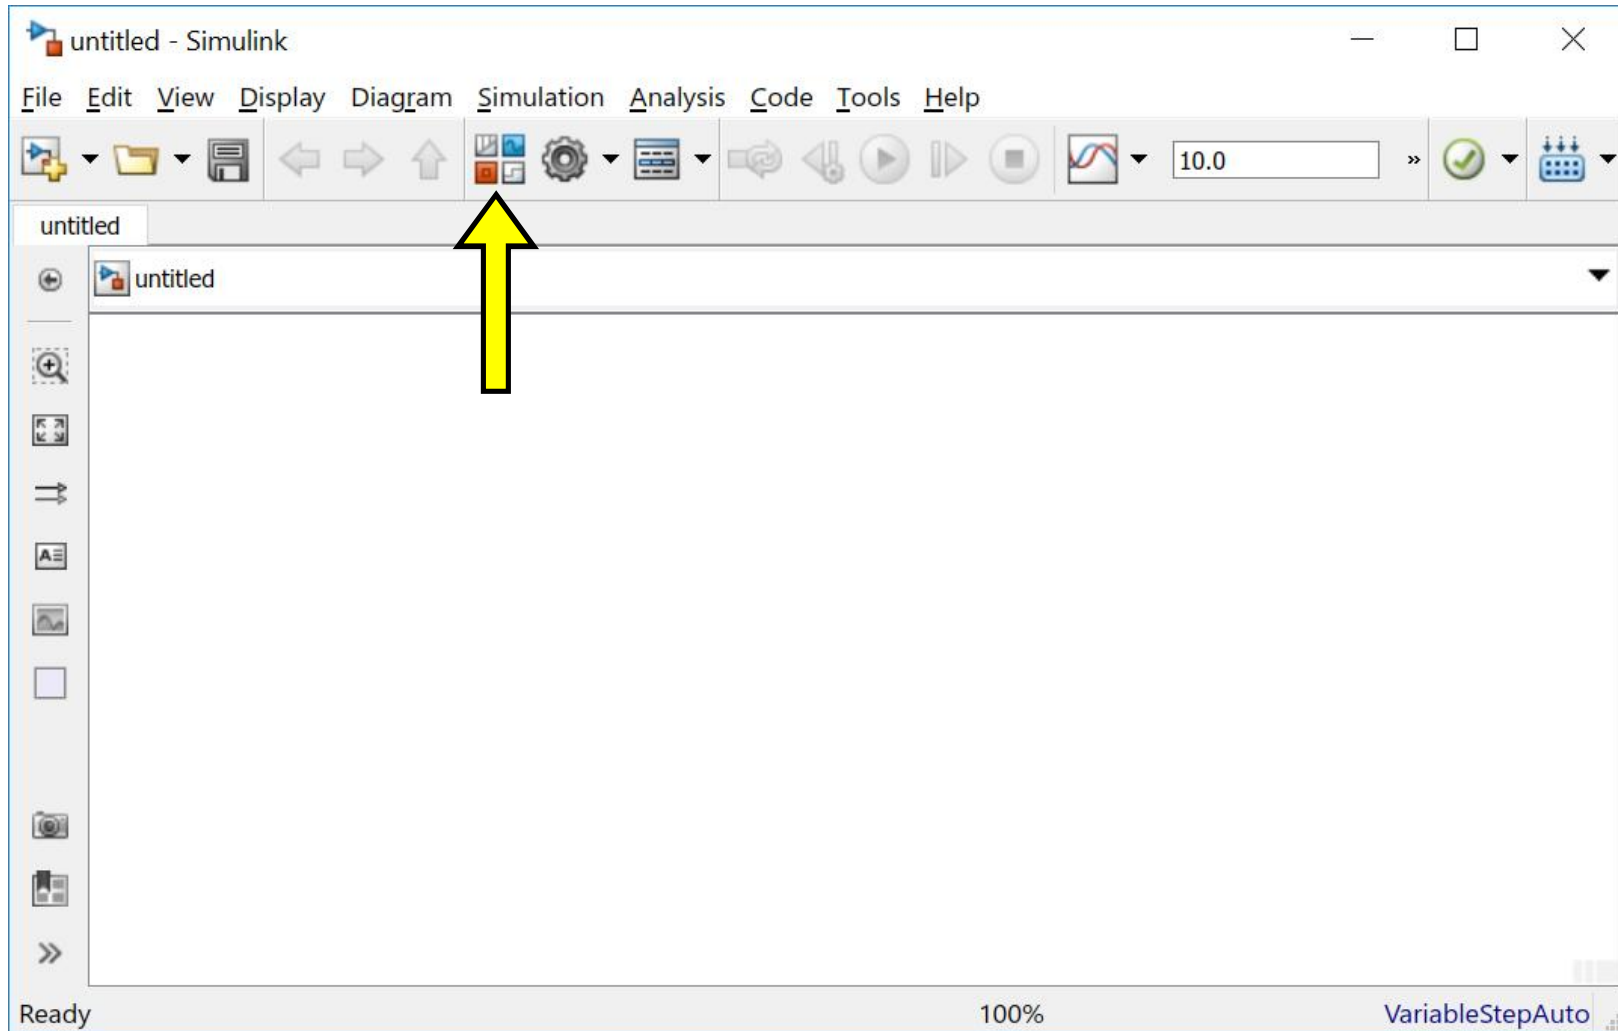

MATLAB

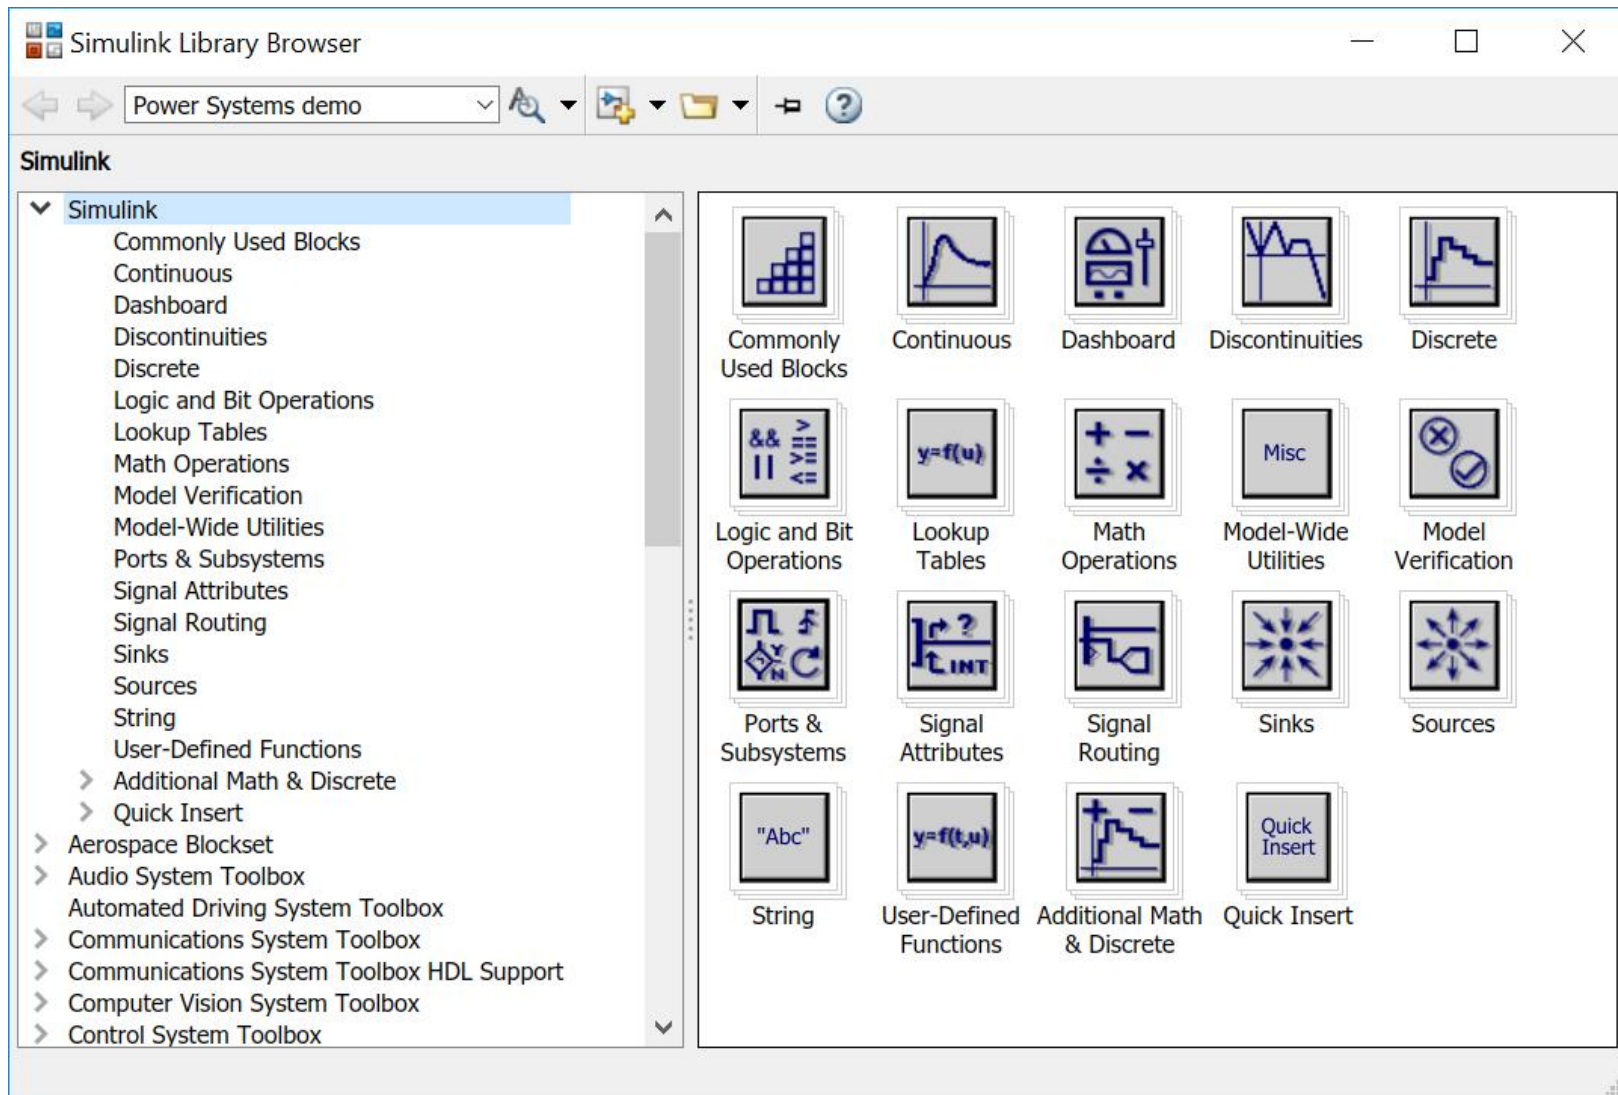

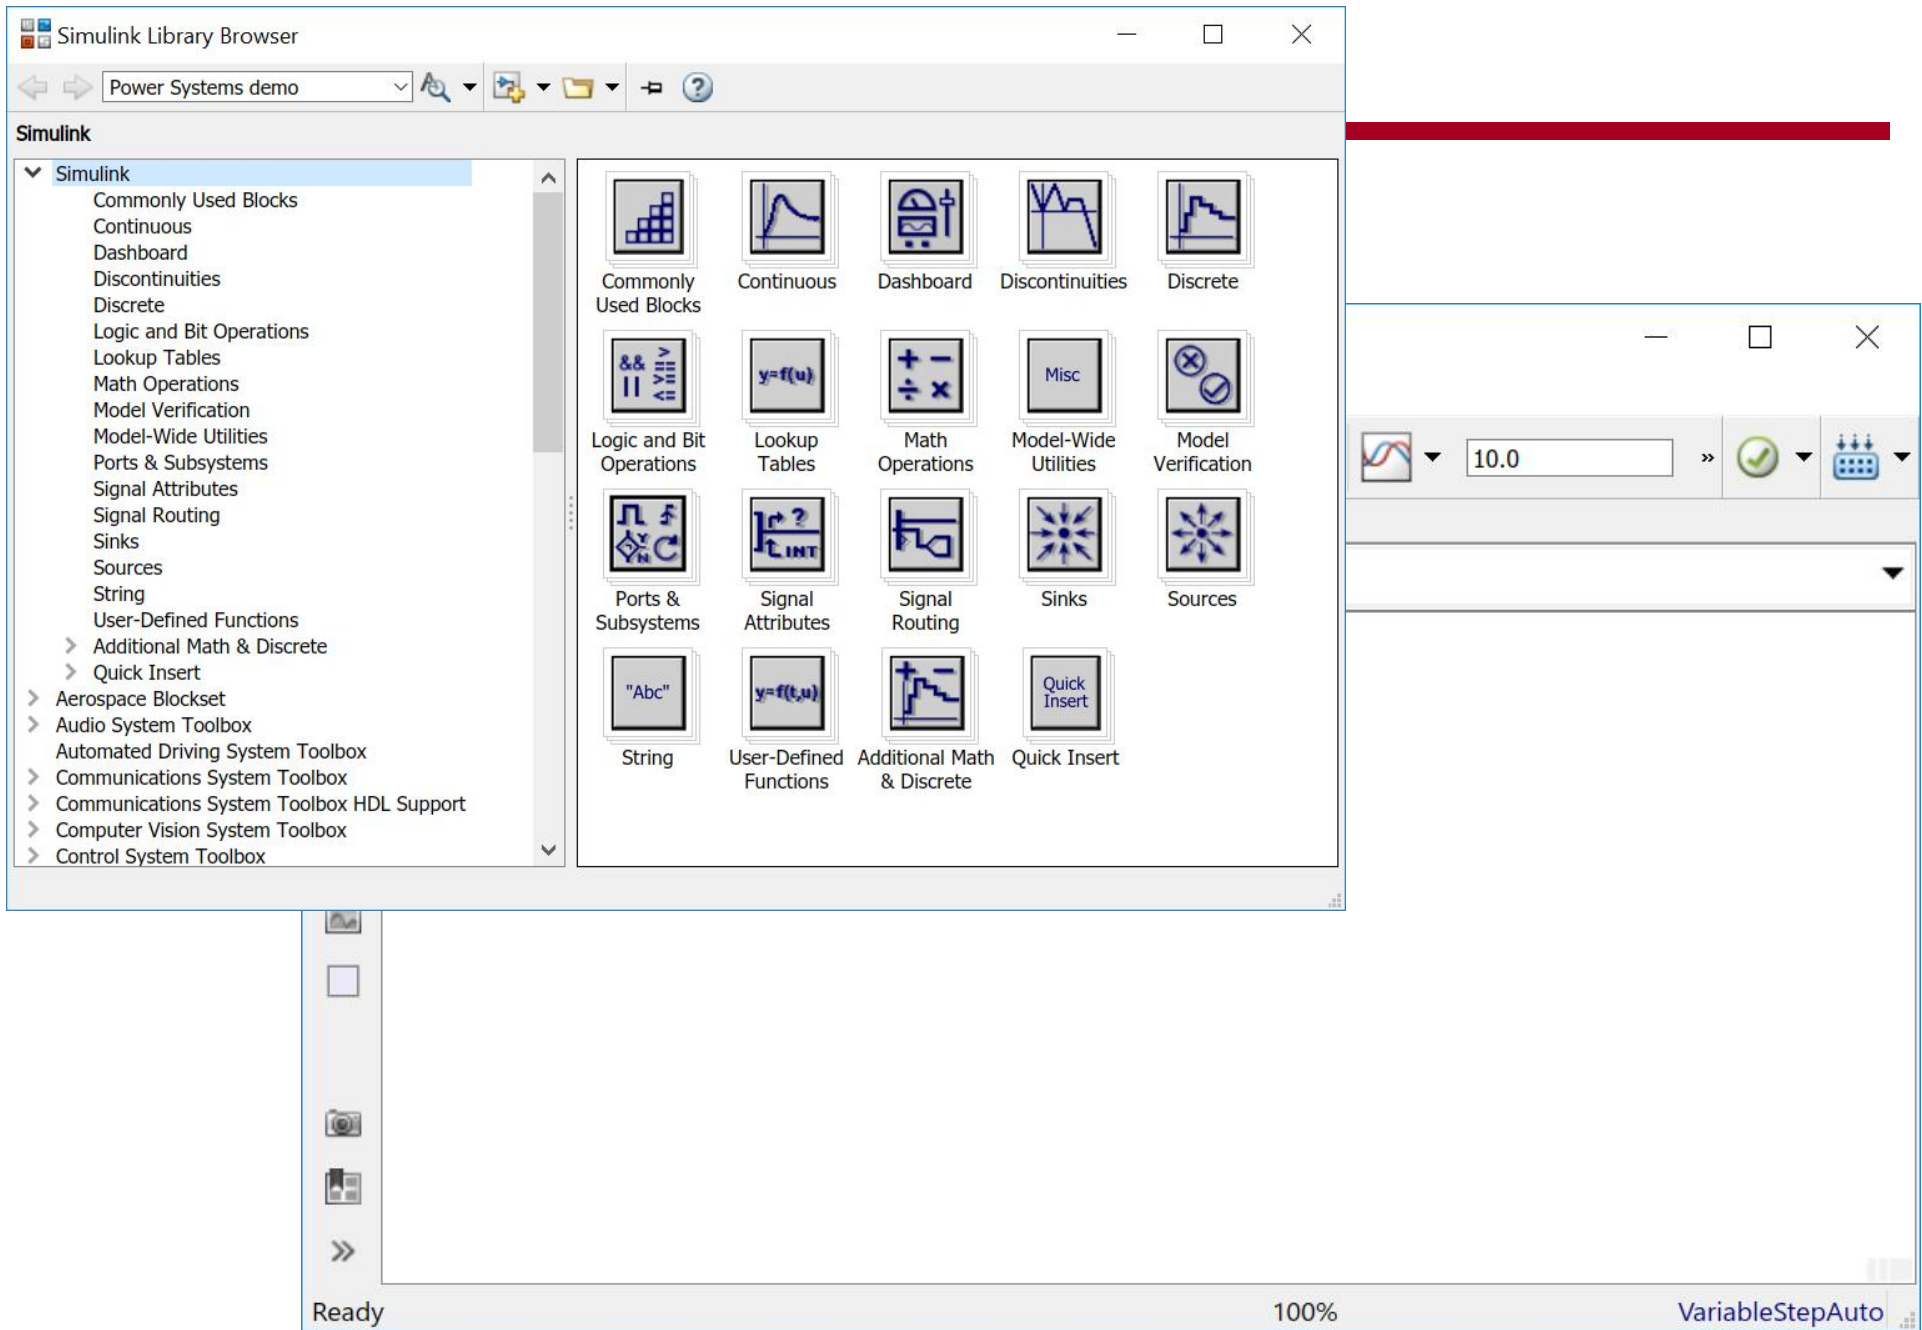

The screenshot shows the Simulink Start Page interface. On the left, there is a sidebar with 'Recent' and 'Projects' sections. The main area has a 'New' tab selected, showing a search bar and a 'My Templates' section. Under 'My Templates', the 'Simulink' category is expanded, and the 'Blank Model' option is highlighted with a red circle. Other options include 'Blank Library', 'Blank Project', and 'Folder to Project'.

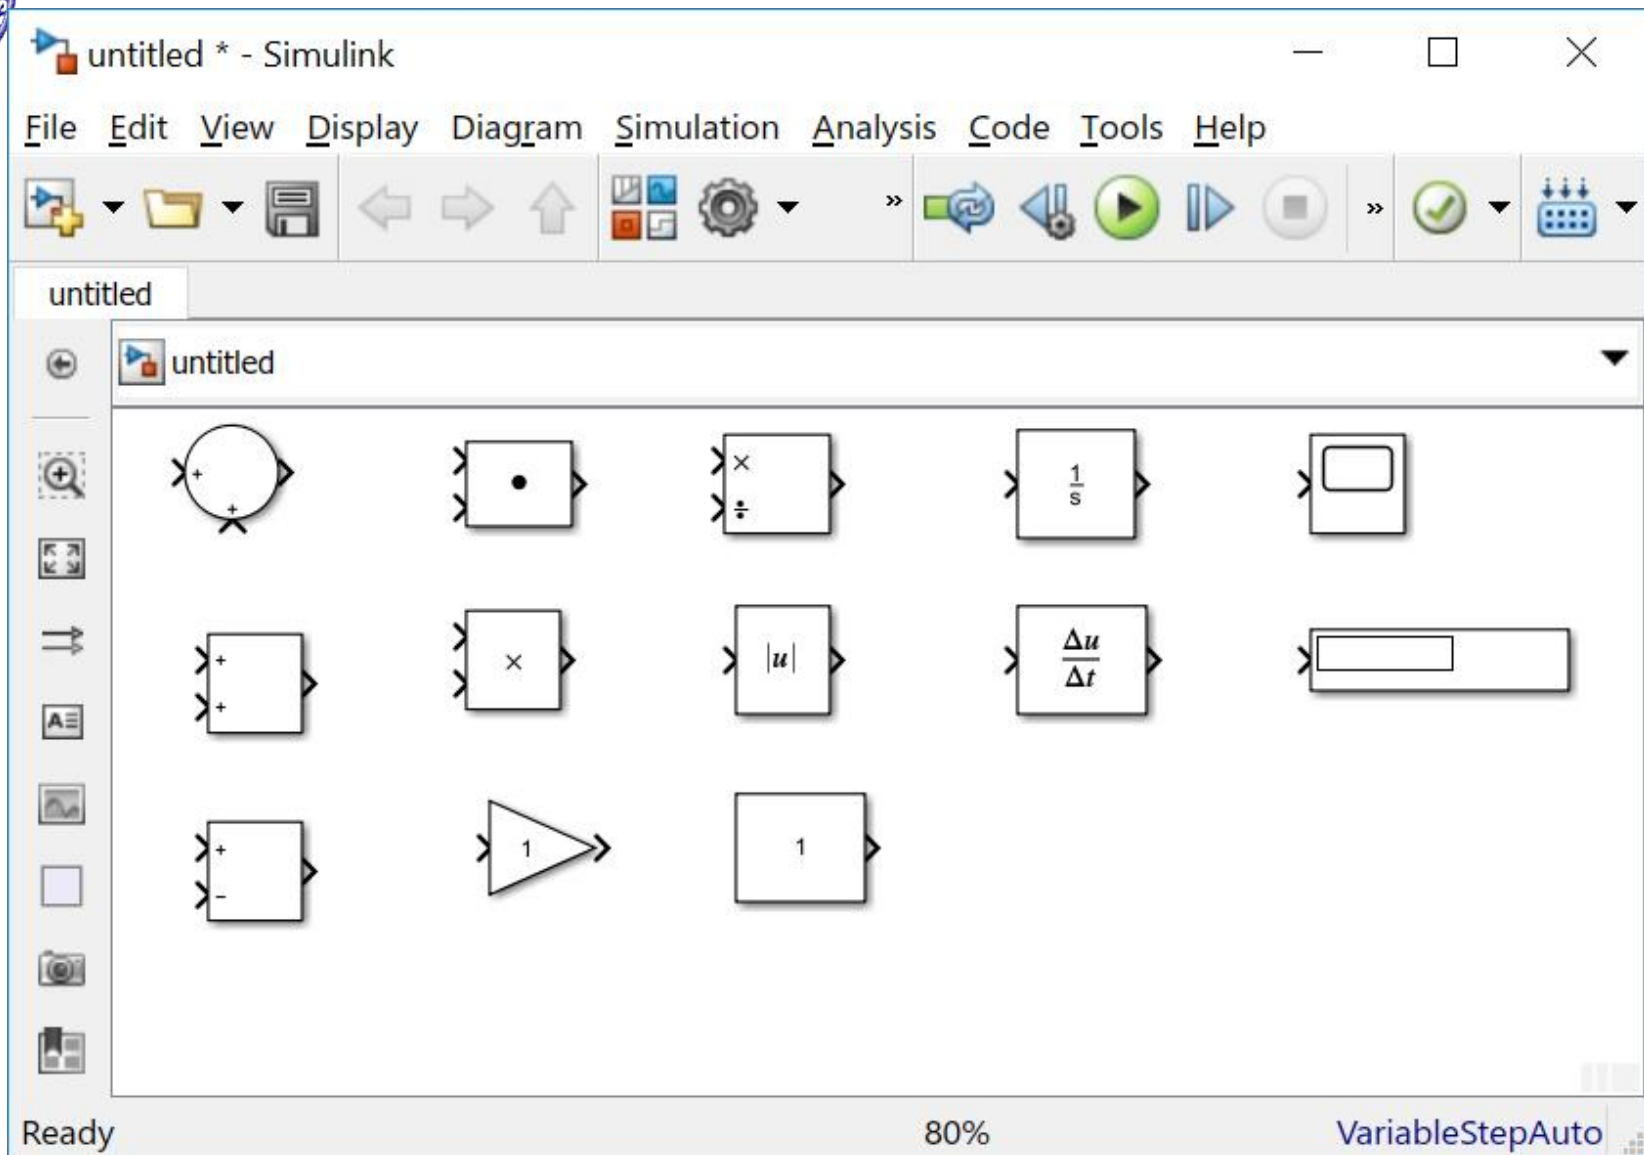

The image shows the Simulink Library Browser window. The title bar reads "Simulink Library Browser". The address bar shows "Power Systems demo". The main area is titled "Simulink/Commonly Used Blocks" and contains a grid of blocks including Bus Creator, Bus Selector, Constant, Data Type Conversion, Delay, Demux, Discrete-Time Integrator, Gain, Ground, In1, Integrator, Logical Operator, Mux, Out1, Product, Relational, Saturation, and Scope. A yellow arrow points from the right side of the grid to a yellow text box containing the text "Drag elements here".

# Simulink as an equation solver

$$C = A + B$$

$$D = A - B$$

# Simulink as an equation solver

$$E = A.B$$

$$F = A / B$$

## Simulink as an equation solver

# Simulink as an equation solver

## Simulink as an equation solver

$$10 = 10x(t) + 5 \int x(t) dt$$

$$10x(t) = 10 - 5 \int x(t) dt$$

**Example**

Simulate the series connected RLC circuit and plot the time response of the current  $i(t)$

$$e = Ri + L \frac{di}{dt} + \frac{1}{C} \int i dt$$

$$L \frac{di}{dt} = e - Ri - \frac{1}{C} \int i dt$$

**Example 6**

$L=2\text{ H},$   
 $R=100\text{ Ohm};$   
 $C=100\text{ F}$   
 $E=50\text{ V}$

$$L \frac{di}{dt} = e - Ri - \frac{1}{C} \int i dt$$
